A Observed passive motion (D0) from camera 0, never used for fitting (frame 24)

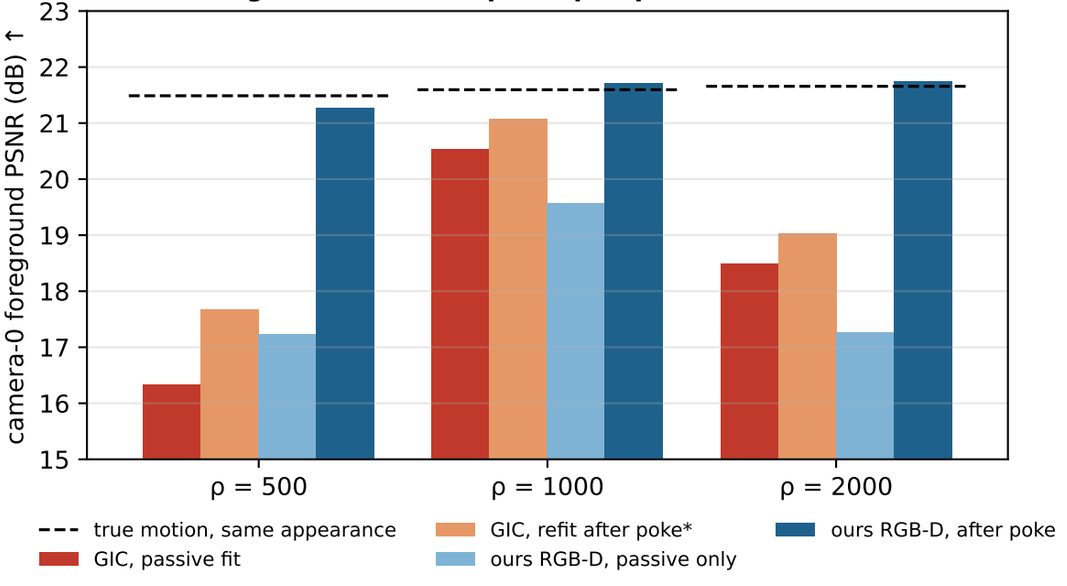

GIC reproduces the motion it was fitted to: its deformation network reaches 24.9 dB on the unseen camera, and its physics replay 20.6 dB. Fitting quality does not reveal whether a new force will be predicted correctly (B-D).

B Held-out push D2b (15 N down + 20 N sideways at 0.75 L), density 500 kg/m³, frame 24; bottom row: |prediction - reference| x4

Same GIC-learned appearance for every motion source; *refit uses its own refit appearance. Ours: RGB-D.

C Rendering of the held-out push (prospective)

D Physics of the same push (prospective)
